Abstract

The **ezAccount System** is a simple and practical tool designed to help business owners manage their finances more easily and accurately. Instead of relying on Microsoft Excel or manually writing down transactions, which can be time-consuming and prone to errors, this system automatically records income, expenses, and other financial activities in an organized way. It stores everything in one place, making it easier to track and access past records whenever needed. The system can also generate useful reports such as monthly summaries and profit and loss statements, helping users better understand their business performance. With **ezAccount System**, business owners can stay organized, save time, and focus more on growing their business rather than dealing with paperwork and manual calculations.

1.0 INTRODUCTION

Nowadays, many small business owners still use tools like Microsoft Excel or Word to calculate profits, track sales, and manage their daily spending. These tools are easy to start with and quite common, but as the business gets bigger, the work can become messy, confusing, and take up too much time. That's why our group decided to build **ezAccount System**, it is a simple and friendly accounting system made specially for small businesses. Our goal is to make calculations easier, reduce mistakes, and save time so business owners can focus on what really matters, that's growing their business.

ezAccount System is designed to be affordable and easy to use, even for those without any accounting experience. It helps track income and expenses, and create clear summaries and reports. The system can also automatically show how the business is doing on a weekly, monthly, quarterly, and yearly basis, making it easier to spot trends and make better decisions. With **ezAccount System**, we want to take the stress out of managing business finances and offer a smoother, more comfortable experience for every small business owner.

1.1 Project Background

In recent years, many small businesses have continued to rely on basic tools like Microsoft Excel and Word to handle their financial tasks such as calculating profits, tracking sales, and managing daily expenses. While these tools are widely used and easy to access, they are not designed for accounting purposes. As a business grows, using these tools can become inefficient, confusing, and prone to errors, especially for those without an accounting background.

To address this problem, our group is developing **ezAccount System**, it is a simple, user-friendly, and affordable accounting solution tailored specifically for small businesses. This system aims to help business owners handle their finances more effectively, without the need for complex software or professional accounting knowledge. **ezAccount System** provides features that allow users to track income and expenses, generate clear financial summaries, and view business performance automatically on a weekly, monthly, quarterly, and yearly basis.

By providing a more organized and comfortable way to manage finances, **ezAccount System** supports small business owners in making smarter decisions, saving time, and focusing more on running and growing their business.

2.0 PROBLEM STATEMENT

On top of that, many small business owners find it hard to connect their finances with other parts of the business, like inventory, payroll, or customer management. Without everything in one place, they often end up repeating work, keeping inconsistent records, and missing out on useful insights that could help them make better decisions. The problem statements are:

- Many small business owners still rely on Microsoft Excel or Word for accounting tasks, which are not designed for efficient financial management.
- As the business grows, using manual tools becomes messy, time-consuming, and increases the risk of calculation errors.
- Business owners without accounting knowledge struggle to understand their business performance due to a lack of clear and automated reporting tools.

3.0 OBJECTIVE

To develop **ezAccount System**, a user-friendly and affordable accounting tool that helps small business owners manage their finances more efficiently and gain better insights into their business performance. In fact, the objectives of **ezAccount System** are:

- i. To make it easier for small business owners to move away from Microsoft Excel or Word by offering a simple system that helps them track their finances in one place.
- ii. To save time and avoid common calculation mistakes by letting the system handle things like adding up income, tracking expenses, and generating reports automatically.
- iii. To help business owners clearly understand how their business is doing by showing easy-to-read reports every week, month, quarter, and year.

4.0 PROJECT SCOPE

4.1 System Scope

i. Business Owner:

- Add and manage supplier details, item descriptions, prices, and stock quantities.
- View and search all past transaction records.
- Generate financial summaries on a monthly, quarterly, or yearly basis.
- Create and manage sales and transaction records for business tracking.

ii. System Admin:

- Manage and maintain all user accounts in the system.
- Oversee database storage and ensure that all data is safe and regularly backed up.
- Monitor system performance and fix technical issues or system errors promptly.
- Maintain the confidentiality of the system by controlling access and protecting sensitive data.
- Ensure the system runs smoothly, stays up to date, and remains accessible to all users.

iii. Staff:

- Assist the business owner by managing stock entries when the business owner is not available.
- Add and update stock details such as item names, prices, and quantities.
- Help ensure stock records are always accurate and up to date.

4.2 User Scope

i. Business Owner

ii. System Admin

iii. Staff

5.0 LITERATURE REVIEW

This chapter examines existing financial management and accounting systems, focusing on their features and strengths in supporting small businesses. It also discusses their limitations, highlighting areas where future solutions can be improved.

5.1 Bukku Accounting

Bukku Accounting is a Malaysian cloud-based accounting platform developed for small and medium-sized enterprises (SMEs). Figure 5.1 shows the main interface of Bukku Accounting. It offers an accessible way for businesses to manage their financial records online without needing to install any complex software. The login interface is clean and intuitive, allowing business owners and accountants to easily access their financial data from anywhere with an internet connection.

Figure 5.1: Bukku Account Main Interface

Once logged in, users can explore a range of modules designed to support day-to-day accounting tasks. These include invoice generation, expense tracking, bank reconciliation, and financial reporting. With its user-friendly design and centralized online access, Bukku helps streamline accounting processes, making it easier for SMEs to stay organized and focus more on growing their business.

Website Link: <https://bukku.my/bukku-for-smes>

5.2 Financio Accounting

Financio is a cloud-based accounting platform specifically built for micro and small businesses in Southeast Asia. Figure 5.2 shows the main interface of Financio Accounting. It offers a modern and easy-to-navigate web interface that allows users to manage their accounts anytime and from anywhere with internet access. The login page is clean and mobile-friendly, providing fast access to essential accounting tools without requiring any software installation.

Figure 5.2: Financio Accounting Main Interface

Once logged in, Financio provides features like e-invoicing, expense tracking, bank reconciliation, GST-ready reports, and multilingual support. It simplifies daily accounting tasks with automation and built-in guides, making it user-friendly even for non-accountants. As a web-based system, it ensures that all data is stored securely in the cloud, and updates are managed automatically, reducing the need for manual maintenance.

Website Link: <https://financio.co>

5.3 Xero Accounting

Xero is a well-known cloud accounting platform trusted by small and medium-sized enterprises worldwide. Figure 5.3 shows the main interface of Xero Accounting. Its interface is browser-based and designed to work seamlessly across devices, allowing users to access financial data on the go. The login screen reflects its professional and global branding, making it clear that users are entering a full-featured financial environment.

Figure 5.3: Xero Accounting Main Interface

Inside the platform, Xero supports a wide range of functions such as invoicing, payroll, real-time bank feeds, inventory tracking, and financial reporting. It also integrates with hundreds of business apps, giving users flexibility in managing operations. Its cloud infrastructure ensures secure storage, fast performance, and real-time collaboration between business owners and accountants, making it highly efficient for businesses of all sizes.

Website Link: <https://www.xero.com>

Table 5.1 shows that each accounting system targets different users. Bukku suits local SMEs with essential, affordable features; Financio focuses on small businesses with simple, user-friendly tools and a free plan; Xero serves SMEs and larger companies with advanced, scalable features. Overall, Bukku emphasizes affordability, Financio simplicity, and Xero global reach.

Table 5.1: Comparison Of Several Website Characteristics

NO	CHARACTERISTICS	Bukku Accounting	Financio Accounting	Xero Accounting
1.	Target Users	SMEs and Accountants	Micro and Small Businesses	SMEs and Accountants
2.	Key Features	Bookkeeping, Reports, Bank Reconciliation	Auto-journal entries, Tax, Invoicing	Invoicing, Inventory, Payroll, Bank Feeds
3.	Accessibility	Accessible from browser	Web, Android, iOS	Web, Android, iOS
4.	User Interface	Simple and Localized	Modern and Friendly	Sleek and Professional
5.	Pricing (Basic plan)	Affordable for SMEs	Free (Basic), Paid Plans Available	Paid plans only
6.	Scalability	Good for growing local SMEs	Best for micro to small businesses	Very scalable for global SMEs and larger companies

6.0 METHODOLOGY

The Agile model is a development approach that focuses on flexibility, speed, and user involvement. Instead of waiting until the entire system is complete, Agile breaks the work into smaller steps called sprints. Figure 6.1 shows the Agile methodology diagram. Each sprint delivers a usable part of the system, so important features can be tested and used earlier. This step-by-step process not only speeds up progress but also reduces the risk of big mistakes, since issues can be detected and fixed quickly. Another advantage of Agile is how easy it is to adapt to changes. If users or administrators suggest new ideas, improvements can be added smoothly without having to start the project all over again.

Agile also ensures that the system is always built with the user in mind. Because feedback is collected regularly from users and stakeholders, the system can continuously evolve to match real needs. This makes the end product more practical, user-friendly, and reliable for daily use. By involving users throughout the development process, the gap between what developers create and what users actually need is greatly reduced. In short, Agile provides a more dynamic, responsive, and efficient way of building systems, making it the best choice for projects that require flexibility and continuous improvement.

Another key strength of Agile is its ability to promote teamwork and clear communication. Developers, users, and stakeholders work closely together throughout the process, which builds trust and ensures everyone is on the same page. Regular meetings and updates keep the project transparent, so problems can be identified early and solutions can be discussed openly. This collaborative environment not only improves the quality of the system but also makes the development process smoother and more efficient. By encouraging cooperation, Agile helps ensure that the final system is well-built, timely, and meets the goals of both users and the organization.

Figure 6.1: Agile methodology diagram

Explanation of Components in Agile methodology diagram:

1) Requirements – The first phase begins with gathering requirements, where the team works closely with small business owners and stakeholders to identify what the ezAccount System must include. Key requirements might be income and expense tracking, financial summaries, and stock management. The team also determines priorities, defines system goals, and collects user expectations. This ensures the project starts with a clear understanding of what the system needs to deliver.

2) Design – In the design phase, the system layout, interface, and database structures are carefully prepared. The goal is to ensure that the system is simple, well-organized, and easy to use for small business owners. This includes designing clear dashboards, input forms, and report layouts while also making sure the database can store and manage data effectively.

3) Development – The development phase focuses on building the system features step by step through short iterations. For example, the team may first develop the income and expense module, test it, and then move on to financial reports. Each part of the system is built and tested before moving forward, reducing errors and ensuring stability throughout the process.

4) Testing – Once features are developed, the testing phase is carried out to check for any calculation mistakes, formatting issues, or usability problems. This stage ensures that the system is accurate, reliable, and user-friendly. It is especially important because many small business owners using the system may not have accounting knowledge.

5) Deployment – After successful testing, the system moves into the deployment phase, where a working version is released for real users such as business owners, system admins, or supervisors. This early release allows them to use the system in their daily operations, providing a practical test of how the system performs in real-world conditions.

6) Review & Feedback – Following deployment, the team gathers feedback from users to understand their experiences with the system. Business owners and system admins may suggest improvements such as clearer reports, faster data entry, or easier ways to manage stock. This stage is essential because it reflects how the system actually supports business activities.

7) Iteration – In the iteration phase, the team refines and improves the system based on the feedback received. This could mean enhancing existing features, fixing weaknesses, or adding new functions requested by users. After improvements, the system goes through testing and deployment again, continuing the Agile cycle until the system fully meets the needs of small business owners.

7.0 GANTT CHART

Table 7.1 Gantt chart shows the overall timeline of the project, starting with gathering requirements and preparing the proposal, followed by designing the system interface and database. The middle phase focuses on development, where key modules like income, expenses, and reports are built and integrated. After that, testing is carried out to fix bugs and ensure the system works smoothly. The project then moves into deployment for trial use, with feedback collected from users to refine the system. Finally, improvements are made before the final report and presentation. Key milestones like proposal presentation, demonstrations, and the final showcase help track progress along the way.

Table 7.1: Gantt Chart for Methodology (Agile Model)

Task / Description	W1	W2	W3	W4	W5	W6	W7	W8	W9	W10	W11	W12	W13	W14
1.0 Requirement Phase														
1.1 Meet with supervisor and confirm project scope														
1.2 Gather requirements from small business owners														
1.3 Identify core features (income, expenses, reports)														
1.4 Prepare project proposal & Gantt chart														
Proposal Presentation														
2.0 Design Phase														
2.1 Design system interface (dashboard, input forms)														
2.2 Design database structure														
2.3 Create mockups/wireframes														
2.4 Review design with supervisor/team														
3.0 Development Phase														
3.1 Set up development environment														
3.2 Develop income & expense tracking module														
3.3 Develop report generation module														
3.4 Integrate database with UI														
Demonstration 1														
4.0 Testing Phase														
4.1 Perform unit testing on each feature														
4.2 Conduct integration testing														
4.3 Identify and fix bugs														
4.4 Test usability for small business owners														
Demonstration 2														
5.0 Deployment Phase														
5.1 Deploy prototype system for trial use														
5.2 Check live system functionality														
5.3 Ensure data backup and security setup														
6.0 Review & Feedback Phase														
6.1 Collect feedback from business owners/admins														
6.2 Analyze system strengths and weaknesses														
6.3 Document feedback results														
7.0 Iteration & Final Presentation														
7.1 Refine and improve system features														
7.2 Re-test improved modules														
7.3 Prepare final report & documentation														
Demonstration 3														

8.0 REQUIREMENT SPECIFICATION

8.1 Hardware Requirement

Table 8.1 outlines the hardware requirements needed for the project, with three different laptop models suggested based on performance and cost. The Acer Predator Helios Neo 16, priced at RM6,000, is the most powerful option with an Intel Core i7 processor, NVIDIA RTX4060 GPU, and 32GB DDR5 RAM—suitable for heavy processing tasks. The Huawei Mate 15, at RM3,000, offers a more affordable choice with an Intel Core i3 processor and 8GB RAM, making it practical for lighter usage. Meanwhile, the Dell Latitude 7480, priced at RM1,600, provides a budget-friendly option with decent specifications for basic operations. Overall, the total estimated cost for the hardware is RM10,600, covering different needs from high-performance to cost-efficient setups.

Table 8.1: Hardware Requirement

Specification	Description	Cost (RM)
Model	i. -Acer Predator Helios Neo 16 ii. -Huawei Mate 15 iii. -Dell Latitude 7480	6,000.00 3,000.00 1,600.00
Processor	i. INTEL Core i7-14700HX ii. INTEL Core i3-10110U iii. INTEL Core i5-8350U	In Package
GPU (Graphical Processing Unit)	i. NVIDIA GeForce RTX4060 ii. INTEL(R) UHD Graphics iii. INTEL(R) UHD Graphics 620	In Package
RAM (Random Access Memory)	i. 32GB DDR5 5600Mhz ii. 8GB DDR4 2400Mhz iii. 16GB DDR4 2133Mhz	In Package
Operating System	i. Windows 11 Pro ii. Windows 11 Home iii. Windows 11 Pro	In Package
TOTAL PRICE		10,600.00

Table 8.2 outline the project's cost planning is designed to cover all essential expenses. The domain and hosting are estimated at RM90, while banners and posters are allocated RM250 for promotional purposes. Preparing the report is expected to cost RM60, and internet usage is budgeted at RM200. Booth decoration requires RM100 to create an appealing setup, and petrol for transportation is planned at RM50. The total estimated cost for all these items amounts to RM750.

Table 8.2: Cost Planning

Number	Item	Amount (RM)
1	Domain + Hosting	90.00
2	Banner, poster	250.00
3	Report	60.00
4	Internet	200.00
5	Booth decoration	100.00
6	Petrol	50.00
TOTAL		750.00

8.2 Software Requirement

To successfully develop and run the **ezAccount System**, certain software is required. These tools and platforms are important because they help the development team to build the system, test it, and make sure it works properly for end users. The software requirements include the operating system, programming language, database, and other supportive tools that ensure the project can be developed smoothly and maintained in the future. Each software chosen has been carefully considered to match the scope of the **ezAccount System**, which focuses on account management, record keeping, and easy user interaction.

Table 8.3 lists the software needed for the ezAccount System, covering development, database management, design, documentation, presentation, collaboration, testing, and security. Tools like Visual Studio, MySQL, and XAMPP support coding, data storage, and local testing, while StarUML and Pencil help with system and UI design. Microsoft Word and PowerPoint aid documentation and presentations, cloud storage ensures file safety, and browsers, antivirus, and optional Python support testing, security, and future automation needs.

Table 8.3: *Software Requirements for ezAccount System*

Software	Category	Purpose / Why Needed
1. Microsoft Visual Studio / Visual Studio Code	IDE (Integrated Development Environment)	To write, debug, and manage the source code for the ezAccount System. It provides an easy environment to code using web technologies like HTML, CSS, JavaScript, and backend languages such as PHP or C#. It also helps detect and fix errors quickly.

2. Microsoft Access / MySQL	Database Management System (DBMS)	To store and manage important data such as supplier details, transaction records, and account information. The database makes it easier to search, update, and organize data in a structured way.
3. StarUML	Modeling & Diagram Tool	To design system diagrams such as use case, class, and sequence diagrams. This helps the team plan the system clearly and explain the workflow in a visual way that is easier to understand.
4. Microsoft Word	Documentation Tool	To prepare documents such as the project proposal, reports, and user manual. It ensures all written parts of the project are neat and professional.
5. Microsoft PowerPoint / Canva	Presentation Tool	To create slides for proposal defense, progress meetings, and final presentation. It helps explain the project ideas and results clearly to lecturers and evaluators.
6. Google Drive / OneDrive	Cloud Storage & Collaboration	To store project files safely in the cloud, share them with teammates, and make sure there are backups in case the laptop or PC has problems.

7. Pencil	UI/UX Design Tool	To design user interface prototypes so the team and users can see how the system will look before actual development. This helps improve user experience and design.
8. XAMPP / WAMP	Local Server Environment	XAMPP/WAMP will act as a local server to run and test the system before it goes live. It allows the team to simulate how the system works on a real server, making debugging and testing easier.
9. Antivirus / Windows Security	Security Tool	To protect the development environment from viruses, malware, or data loss. This ensures coding and testing can be done safely without interruption.
10. Browsers (Google Chrome, Edge, Firefox)	Testing Tool	To check if the ezAccount System works properly across different browsers. This ensures all users can access the system smoothly, no matter which browser they use.

11. Python (Optional)	Data Processing / Automation	Can be used if there's a need for extra automation, analytics, or machine learning features in the future. For example, analyzing transaction records or generating automated reports.
------------------------------	---------------------------------	--

8.3 Security Requirement

The **ezAccount System** places security as a top priority because it handles sensitive financial data, including transaction records, account details, and business reports. To ensure the system is safe, reliable, and trustworthy, several security measures and error-handling features are included.

First, the system uses a secure login process where users must enter unique IDs and strong passwords. These passwords are stored in encrypted form, making it harder for unauthorized people to access them. Access is also role-based, meaning business owners and administrators can use advanced features, while staff accounts have limited access for extra safety.

The system also performs strict input validation such as checking that no fields are left blank or filled with the wrong format. This not only reduces user mistakes but also prevents harmful attacks like SQL injection.

For error handling, the system is designed to respond in a user-friendly way. If something goes wrong, such as a failed login or a missing record, users will see clear and simple error messages without revealing any technical details. Meanwhile, the system logs all errors in the background so administrators can review and fix them quickly.

To further protect business information, the system carries out regular data backups and stores records securely. This ensures data can be restored in case of a system failure or unexpected issue.

Overall, these security and error-handling measures make the **ezAccount System** not only safe and reliable but also easy to use, giving business owners peace of mind that their financial data is well protected.

9.0 RECOMMENDATION AND CONCLUSION

The **ezAccount System** was created to make managing financial transactions, reports, and records simpler and more reliable. From the start, the main goal was to build a system that is easy to use, safe, and practical for business owners. With features such as secure login, proper data validation, backup options, and a straightforward interface, the system helps small and medium businesses handle their day-to-day financial tasks with ease and confidence.

Based on the development process and user feedback, there are several ways the system can be improved in the future. For example, adding two-factor authentication would make accounts even more secure, while mobile access would allow business owners to manage their finances anytime and anywhere. Another useful addition would be automated financial insights, which could help users make smarter business decisions by analyzing their data. It is also recommended to keep the system updated regularly and gather continuous feedback from users, so that it remains relevant as technology and business rules change.

In conclusion, the **ezAccount System** has achieved its goal of providing a safe, reliable, and efficient way to manage financial information. The current features already give business owners important benefits, such as reducing errors, saving time, and ensuring their data stays protected. At the same time, the system provides a strong base for future upgrades that could make it even more powerful and convenient. Overall, this project shows how a well-designed system can truly support businesses in managing their accounts effectively while also adapting to future needs.

9.1 Recommendation

To make the **ezAccount System** even more useful and valuable for business owners, a few future improvements are suggested. One important step is adding two-factor authentication (2FA) to strengthen security and protect user accounts from unauthorized access. Another enhancement would be making the system mobile-friendly or providing a dedicated mobile app, so users can conveniently manage their finances anytime, anywhere.

It would also be beneficial to include automated financial insights and analytics, such as tracking expense trends, predicting cash flow, and generating profit summaries. These features can give business owners a clearer picture of their finances and support better decision-making. Additionally, cloud integration could be introduced to allow real-time data syncing and secure backups, ensuring records remain safe and accessible even if the main device fails.

Finally, conducting regular updates and ongoing feedback sessions with users will help keep the system up-to-date with evolving business needs and technology. Together, these improvements can enhance the user experience and position **ezAccount System** as a reliable, long-term solution for financial management.

9.2 Conclusion

In conclusion, the **ezAccount System** was developed with the goal of making financial management simpler, smarter, and more reliable for business owners. By offering core features like transaction tracking, financial reporting, and secure data handling, the system provides a trustworthy platform that helps businesses manage their accounts with ease. This not only reduces manual work and errors but also saves valuable time that business owners can focus on growing their business.

A strong emphasis has also been placed on security and error handling. With user authentication, data validation, encrypted storage, and exception logging, the system ensures that sensitive financial information is always protected. These features create a sense of trust and reliability, giving users confidence that their financial data is both safe and accessible, even when unexpected issues arise.

Overall, the **ezAccount System** is designed to be practical, user-friendly, and adaptable. It not only improves day-to-day efficiency but also supports better decision-making through accurate records and reports. With its flexible structure and ability to grow based on user feedback, the system holds great potential for future enhancements, ensuring it remains a valuable tool for businesses in today's fast-moving, digital-first environment.

3. Sehubungan dengan itu, saya mewakili pihak POLIMAS ingin memohon kepakaran dan kerjasama daripada pihak tuan/puan dalam membantu pelajar menyiapkan projek akhir selari dengan keperluan kursus DFT50114 Integrated Project. Sebarang pertanyaan, pihak tuan/puan boleh menghubungi Penyelaras Projek yang bertanggungjawab iaitu Pn. Nor Idalaila Binti Aziz di talian 0194657998.

4. Kerjasama dan sokongan yang diberikan oleh pihak tuan didahului dengan ucapan ribuan terima kasih.

Sekian.

"MALAYSIA MADANI"

"BERKHIDMAT UNTUK NEGARA"

Saya yang menjalankan amanah,

(NOOR AZMIZA BINTI IDERIS)
Ketua Jabatan
Jabatan Teknologi Maklumat Dan Komunikasi
b.p Pengarah
Politeknik Sultan Abdul Halim Mu'adzam Shah

Borang Maklumat Projek (Organisasi Luar)		JTMK POLIMAS
MAKLUMAT PROJEK		
A. CADANGAN TAJUK	EZInvoice System EZAccount System	
B. KETERANGAN PROJEK	1	PERNYATAAN MASALAH: 1. Manual and Non-Standard Invoice Generation - Many small business owners still create invoices manually using tools like Microsoft Word or Excel, which is time-consuming and often lacks standardized formatting. 2. Difficulty in Organizing and Storing Financial Records - Invoices and financial statements are often stored in unorganized physical or digital formats, making account reviews and audits inefficient and error-prone. 3. Lack of Awareness in Tax Calculation and LHDN e-Invoice Compliance - Many business owners are unaware of the correct tax rates or the proper structure required by LHDN for e-Invoices, increasing the risk of non-compliance with Malaysian tax regulations.
This system helps businesses create digital invoices easily in LHDN formats, with all important details like customer info, tax, and totals filled in automatically. It reduces manual work and errors, making invoicing faster and more accurate. The system also stores all invoices and expenses in one place, so everything is organized. You can generate monthly or yearly financial reports such as profit and loss statements with just a few clicks.

APPENDIX D

Key Problems and Objectives of discussed project idea

Furthermore, this project aims to **simplify tax estimation** by automating calculations based on net profits using the appropriate corporate tax rates. It also supports users by generating ready-to-download tax-related documents such as simulated **Borang C** and tax summaries, helping business owners to comply more efficiently with LHDN regulations.

By integrating invoicing, financial management, and tax reporting into one user-friendly platform, this system empowers SMEs to improve accuracy, save time, and meet statutory requirements with confidence.

¶ Key Problems (Main Issues):

1. **Manual and Non-Standard Invoice Generation**
 - Many small business owners still create invoices manually using tools like Microsoft Word or Excel, which is time-consuming and often lacks standardized formatting.
2. **Difficulty in Organizing and Storing Financial Records**
 - Invoices and financial statements are often stored in unorganized physical or digital formats, making account reviews and audits inefficient and error-prone.
3. **Lack of Awareness in Tax Calculation and LHDN e-Invoice Compliance**
 - Many business owners are unaware of the correct tax rates or the proper structure required by LHDN for e-Invoices, increasing the risk of non-compliance with Malaysian tax regulations.

Project Objectives

1. **To automate the creation of standard e-Invoices**
 - ↗ – To provide a module that generates invoices in both PDF and JSON formats according to LHDN e-Invoice specifications.
 - To eliminate manual errors and ensure each invoice includes all key details such as customer name, date, invoice number, item list, total amount, and tax (SST) if applicable.
2. **To organize and manage financial records systematically**
 - ↗ – To store all invoices and business expenses in a centralized database with proper categorization.
 - To provide modules for generating income statements and monthly or annual financial reports that can be easily accessed and exported anytime.
3. **To automate tax estimation and generate accurate tax reports**
 - ↗ – To calculate estimated tax based on net profit using relevant corporate tax rates (e.g., 17% or 24%).
 - To generate downloadable reports such as simulated Borang C or tax summary statements, supporting smoother and more accurate tax filing to LHDN.

APPENDIX E

Descriptions of discussed project idea

✓ 1. ezTax e-Invoice System

Kelebihan:

- Ringkas & mudah diingat
- Gaya "startup" yang moden
- Ada elemen "ez" (easy) yang menyampaikan makna mesra pengguna
- Sesuai untuk pengguna yang nak sistem yang **mudah dan efisien**

Kekurangan kecil:

- "ez" agak biasa digunakan dalam banyak jenama, jadi perlu pastikan tak terlalu generik
- Perlu semak kebolehdidafaran jenama jika ingin serius

✓ 2. TaxMate e-Invoice System

Kelebihan:

- "Mate" menyampaikan rasa **mesra, pembantu, rakan bisnes**
- Gaya profesional tetapi santai
- Mudah diterima di kalangan pengguna SME/PKS

Kekurangan kecil:

- Kurang elemen "mudah" secara terus berbanding "ezTax"
- Mungkin sesuai untuk pasaran lebih serius (firm akaun, konsultan)

With the introduction of e-Invoicing by the Inland Revenue Board of Malaysia (LHDN), businesses are now required to generate and submit invoices in a standardized digital format. However, many small and medium-sized enterprises (SMEs) still rely on manual methods such as Microsoft Word or Excel, which are not only time-consuming but also prone to errors and inconsistencies. This creates challenges in tax reporting, financial tracking, and regulatory compliance.

To address these issues, this system is developed to **automate the creation of standard e-Invoices**, following LHDN's specifications in both PDF and JSON formats. By minimizing manual processes, the system helps reduce errors and ensures that all essential invoice details — including customer information, dates, item descriptions, tax amounts, and totals — are accurately captured and formatted.

Beyond invoicing, businesses also face difficulties in maintaining organized financial records, which are crucial for decision-making and tax submission. This system provides features for **centralized storage and management of invoices and expenses**, along with the ability to generate monthly or annual financial reports such as profit and loss statements.
